

easy stone walls

Pre-mixed drywall paste, craft type acrylic paint and a mold made from a cat litter pail lid can make anyone an expert "Stone Mason" in any scale.

step 1

Mix water based acrylic paint with the drywall paste.

step 2

Spread it out evenly onto your "casting surface" (Mold). Here I have used the lid from a pail of cat litter as my mold. This is where you determine the thickness of your stone. I wanted flat, semi-thin rocks, so I went about 2 -3 mm's thick on the spread. Let dry for at least 12 hours.

step 3

Once dry, it can be broken into whatever size stone you require (this is why this process works so well in any scale).

step 4

I used a piece of scrap sheet styrene as a base to ease assembly and facilitate any detail painting, drybrushing, etc.. I used Crazy Glue (CA) in assembly but I'm sure that you're favorite brand will do as well.

step 5

The assembly was attached to the base upon its completion.

editors wrap-up

That covers the basic technique. You should seal it and finish it with standard techniques. Dave shows his materials and finishing techniques.
